Function Definition

Example: $f(d,v) = \left(v_1^d + \dots + v_n^d\right)^{1/d}$

Dynamic function definition (dfn):

α is the left argument, ω is the right argument.

f \leftarrow { ($+\omega * \alpha$) * ($\div \alpha$) }

Traditional function definition (tradfn):

∇ : begin/end defun. “ $\nabla R \leftarrow A\ f\ B\ ;U\ ;V$ ” is “f takes left arg A, right arg B, has local vars U, V, and returns result in R”.

$\nabla res \leftarrow d\ f\ v\ ;sq\ ;sum$

```
sq ← v * d
sum ← +/sq
res ← sum*(÷d)
```
